autogenous tooth transplantation an alternative to dental
May 29th, 2020 - The earliest reports of tooth transplantation involve slaves in ancient egypt who were forced to give their
However, allografts were eventually abandoned because of problems of histocompatibility and replaced with autotransplantation.

Autotransplantation of teeth is a surgical technique for replacing missing teeth. It involves moving a tooth from one location in the mouth to another within the same individual.

Indications for autotransplantation include:
1. Unevenly distributed agenesis
2. Missing lower premolars in Class II good faces
3. Accidentally lost or missing upper incisors
4. Repositioning ectopic teeth

Autotransplantation is useful in dentistry and has been used for decades. Transplanted teeth can survive for an average of 6 years but some survive for 4 decades. Immature teeth survive best as donor teeth, and the shorter the time out of the mouth, the better the success.
