To study the evolution of observed and latent variables as well as the structural equation models over time, dynamic structural equation models can be used. These models allow for the examination of how relationships between variables change over time, providing a more comprehensive understanding of complex systems. Dynamic structural equation models integrate the principles of structural equation modeling with time series analysis, enabling researchers to analyze the dynamic interactions among variables in a continuous or discrete manner. By incorporating time as a variable, these models offer insights into the evolution of relationships, allowing for a more nuanced understanding of how systems and phenomena change over time. This approach is particularly useful in fields such as economics, psychology, and sociology, where the temporal dynamics of variables are of critical importance.
structural equation modeling is a multivariate statistical analysis technique that is used to analyze structural relationships. This technique is the combination of factor analysis and multiple regression analysis and it is used to analyze the structural relationship between measured variables and latent constructs. This method is preferred by the researcher because it estimates the multiple relationships.

‘using mplus for structural equation modeling: a researcher’s guide’

May 28th, 2020 - Ideal for researchers and graduate students in the social sciences who require knowledge of structural equation modeling techniques to answer substantive research questions, using Mplus for structural equation modeling provides a reader-friendly introduction to the major types of structural equation models implemented in the Mplus framework. This practical book, which updates author E. Kevin Thompson’s ‘factor analysis statistical associates blue book series’

June 2nd, 2020 - Factor analysis factor analysis is used to uncover the latent structure dimensions of a set of variables. It reduces attribute space from a larger number of variables to a smaller number of factors, and as such is a non-dependent procedure that does not assume a dependent variable is specified. Is there a good primer introduction to SEM?

June 1st, 2020 - Principles and Practice of Structural Equation Modeling by Rex B. Kline. It covers several practical aspects with a lot of examples. It also has some output using different software.

June 1st, 2020 - Partial least squares structural equation modeling (PLS-SEM) using SmartPLS 3.0. An updated guide and practical guide to statistical analysis. 2nd edition, Kuala Lumpur, Malaysia. Pearson. This book is unique in a sense that it encapsulates four elements in a concise manner.
