**solution to permafrost permanently frozen ground**

May 31st, 2020 - solution to permafrost around 550km of the railway had to pass through the places with permafrost which features soft and wet soil in summer and hard and stretching soil in winter it troubled engineers over the world but the chinese successfully figured out ways to solve the problem and ensure roadbed stability in permafrost regions by graveling embankments and vent pipe roadbed techniques.
Permafrost is the scientific breakthrough of nano chemist Tony Sgarbi. He learned about the problem of oil fouling back in the 1980s and devoted years to discovering the solution. Permafrost is the scientific discovery that could revolutionize the oil industry.

Permafrost is an area of land that is frozen all year round and remains frozen beneath the surface. This phenomenon is significant because it affects the landscape and allows for the formation of unique landforms such as pingos and mounds.

The permafrost layer is critical for maintaining the stability of the landscape and preventing landslides. However, climate change is gradually warming the Arctic, and permafrost is melting, which can lead to soil subsidence, erosion, and landslides. This has significant implications for infrastructure and land use planning in the region.

In conclusion, permafrost is a critical natural resource that has significant implications for the environment and human activity. As climate change continues to impact the Arctic, it is essential to understand the impacts of permafrost melting and develop strategies to mitigate its effects.
